The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis

New isolated mycobacteria polypeptides and nucleic acids - used developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis.

fregment (1) from Mycobacterium tuberculosis that is able to evoke a protective immune response against infections by mycobacteria belonging to the tuberculosis complex. The invention provides a (1) fusion to evoke a polypeptide comprising at least one polypeptide fragment (I) and at least one fusion partner; (2) a fusion polypeptide fragment comprising a T-cell cepitoge from M. tuberculosis protein ESAT-6, or MPT59 and a second different amino acid sequence from M. tuberculosis, and/or including a sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment that encodes the above polypeptides. The polypeptides and nucleic acid are useful as pharmaceuticals, for diagnosis of and as antigens for vaccination against TB caused by Mycobacterium tuberculosis, africanum or bovis. The polypeptides are also useful for diagnosing ongoing or tuberculosis complex. The induction of a strong immune crepsonse in a mammal; use of CFP7B, CFP19 or MPT59-ESAT6 or a T-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC organic acid, a proteinogenic or nonproteinogenic mainto acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a CC saturated or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine CC compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine CC compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine CC compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine CC containing them can be modulated. The presence of (I) or the SRT CC containing them can be used to map the genomes of organisms related to C. glutamicum, to identify and localise C. glutamicum sequences of interest, CC in evolutionary studies, in determination of SRT protein medulating CC for function, in modulating the SRT protein activity, and in modulating CC the activity of an SRT pathway. (II) are used to permit C. glutamicum to conditions to it. (I) and protein molecules encoded by it increase the CC survival of C. glutamicum to chemical and environmentally or chemically convide a means for continued growth and multiplication in large scale CC environmentative growth conditions. By increasing the growth rate or maintaining a normal growth rate in poor or toxic conditions, the yield, conduction and/or efficiency or production of fine chemicals from a conduction and/or efficiency or production of fine chemicals from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                   cc expression in host cells and production of fine chemicals, such as, an corganic acid, a proteinogenic or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine chemical production can be modulated. The presence of [I] or the SRT compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine cc proteins [III] encoded by them are used for diagnosing the presence or containing them can be used to map the genomes of organisms related to C. containing them can be used to map the genomes of organisms related to C. cc quitamicum, to identify and localise C. glutamicum sequences of interest, in evolutionary studies, in determination of SRT protein regions required compound of an environment that is normally environmentally or chemically hazardous to it. [I] and protein molecules encoded by it increase the survival of C. glutamicum to conditions. By increasing the growth rate or maintaining a normal growth rate in poor or toxic conditions, the yield, condition and/or efficiency or production of fine chemicals from a cc culture may be increased.
                                                                                                                                                     밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homelogue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino particularly L-lysine. The present sequence and organic acids, pattern to the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Corynebacterium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the protein sequence of a Corynebacterium CC glutamicum cold shock protein (sep). The invention provides a plant that CC shows improved abiotic stress tolerance as a result of the expression of a Csp in its cells. In one embodiment, a polynucleotide encoding a Csp is CC operably linked to a plant promoter and plant terminator. The polynucleotide preferably encodes a protein comprising a specified Csp conserved motif ADZ21430, particularly Bacillus subtilis CspB ADZ21429 or its homologues, Escherichia coli CspA ADZ21428 or its homologues, a Csp is CC its homologues, Escherichia coli CspA ADZ21429 or its homologues, a csp is constitutive, temporally-regulated, developmentally-regulated, tissue-constitutive, temporally-regulated, developmentally-regulated, tissue-specific, of constitutive, temporally-regulated, developmentally-regulated, tissue-specific, and abiotic stress-tolerant transgenic plant that has been cransformed with a DNA molecule that expresses a Csp is claimed. The plant may be a crop plant, a monocot or dicot, and is especially selected from soybean, corn, canola, rice, cotton, barley, oat, turf grass, cotton cand wheat. The transgenic plant thougheat plant tolerance, cold colerance, salt tolerance, drought tolerance and survival after cold colerance, salt tolerance, drought tolerance and survival after cold shock than the corresponding non-transformed plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

CC AAP70984 to AAP71133 encode the Corynebacterium glutamicum stress, CC rhe C: glutamicum SRT genes (I) can be used in vectors (II) for C: cxpression in host cells and production of fine chemicals, such as, an CC organic acid, a proteinogenic or nonproteinogenic amino acid (preferred), CC a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a CC saturated or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine CC compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine CC compound, a vitamin, a cofactor, a polyketide, or an enzyme. The fine CC compound, a votamic can be modulated. The presence of (I) or the SRT CC containing them can be used to map the genomes of organisms related to C. glutamicum, to identify and localise C. glutamicum sequences of interest, CC containing them can be used to map the genomes of organisms related to C. CC glutamicum, in modulating the SRT protein activity, and in modulating the sequences of interest, CC containing a nenvironment that is normally environmentally or chemically hazardous to it. (I) and protein molecules encoded by it increase the CC survival of C. glutamicum to chemical and environmental hazards and CC survival of C. glutamicum to chemical and multiplication in large scale containing a normal growth rate in poor or toxic conditions, the yield, containing a hard protein continued growth and multiplication, the yield, and protein and hor conditions of fine chemicals from a content on and/or efficiency or production of fine chemicals from a

                                                                               Ś
                                                                                                                Matches
                                                                                                                                         Query Match
                                                                                                                             Best Local
                                                                                                                                                                                             sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nakagawa

the 6213 antibense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting by the creation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway crequired for proliferation, or that inhibits cellular proliferation of the biological pathway in which a proliferation-required gene or a gene on which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a gene on which the test compound that inhibits proliferation of a compound's activity, (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the contiferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational for a content and the content of a condidate molecules for rational care acids are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21-MAR-2001; 2001US-00815242.

                                                                                                                                                                                                                                                                                                                 polypeptides. The invention also relates to a recombinant expression vector comprising a polymucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector comprising the nucleic acid and a cell comprising the recombinant vector. The polymucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid comprising a sequence encoding an Enterococcus polypeptide, useful for preparing a composition for diagnosing treating E. fecalis infection.

                                                                                          ð
                                                                                                                                                                                            CC and 5' untranslated region (UTR) from a cold shock inducible gene, such cases, which directs its expression. An AT-rich sequence that enhances translation under cold shock inducible conditions is present either in the coding sequence of the heterologous polypeptide or in an additional celement inserted between the coding sequence and the cold shock inducible conditions is present either in the coding sequence and the cold shock inducible compacter and 5' UTR. The DNA molecule preferably also includes the cepa CC promoter and 5' UTR. The DNA molecule preferably also includes the need CC for chemical induction, and under cold conditions all ribosomes in the CC host are forced to express the single trarget protein, which simplifies CC purification. When used to prepare isotopically labelled proteins; the CC ulture size, and thus amount of expensive labelled reagent, can be CC reduced. The method can also be used to produce proteins native to cold-cx colimate organisms at high yield
                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the protein sequence of Escherichia coli cold shock protein CspG. The invention provides a DNA molecule or vector at host cell containing the DNA molecule or vector for use in the product of a heterologous polypeptide under conditions that elicit a cold show response in the host cells. The DNA molecule and vector include a
                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New DNA encoding heterologous protein, useful particularly for producing isotopically labeled proteins, includes a cold-shock inducible promoter.

                                                                                                S
                                                                                                                                                                                                                                            The present sequence is the protein sequence of a cold shock protein CC (Csp) from Escherichia coli. The invention provides a plant that shows comproved abiotic stress tolerance as a result of the expression of a Csp is in its cells. In one embodiment, a polynucleotide encoding a Csp is CC operably linked to a plant promoter and plant terminator. The CC polynucleotide preferably encodes a protein comprising a specified Csp CC conserved motif ADZ21430, particularly Bacillus subtilis CspB ADZ21429 or its homologues, Escherichia coli CspA ADZ21428 or its homologues, a Csp CC from Agrobacterium tumefaciens or other Csp protein of the invention, CC such as the present Csp. The promoter is selected from an inducible, constitutive, temporally-regulated, developmentally-regulated, tissue-cc preferred, cold enhanced, cold-specific, stress enhanced, stress-cc predific, drought inducible, water deficit inducible or tissue-specific promoter. An abiotic stress-tolerant transgenic plant that has been CC transformed with a DNA molecule that expresses a Csp is claimed. The CC plant may be a crop plant, a monocot or dicot, and is especially selected from soybean, corn, cancia, rice, cotton, barley, oat, turf grass, cotton and and selected confidence of the transgenic plant that has been confidence of the promoter of the confidence of the corn, cancia, rice, cotton, barley, oat, turf grass, cotton and shear the transgenic plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a crop plant may be a cro

Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a nucleic acid molecule which prolongs the expression of cold shock inducible genes under conditions that elicit the cold shock (cs) response in a bacterium, comprises the 5-UTR of cspI operably linked to a non-native promoter. The nucleic acid is useful for regulating expression of cold shock inducible genes to elicit the cold shock response in bacterium under conditions of physiological stress. The present sequence is Escherichia coli cspG protein used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid comprising the 5-UTR of cspI operably linked to a native promoter, useful for regulating expression of cold shock inc genes to elicit the cold shock response in bacterium under condition

                                                                                                                                                                                                                                                                                                               The invention relates to a family of stimuli-induced in particular stress cc or cold-shock induced genes and proteins. An isolated DNA molecule (I) is provided that comprises a prokaryotic promoter that is induced under conditions eliciting a cold shock response (Csp), or the promoter that is comprise a cc decrease in temperature below the normal physiological growth temperature of the prokaryotic cell, preferably bacterium. (I) is useful for encoding proteins under stimuli-induced, particularly stress or cold-shock induced conditions. The encoded proteins are useful in staining DNA and in the c stabilization of DNA and RNA, and thus increasing the efficiency of DNA cand RNA in various in vitro reactions. The encoded protein is also useful as desaturase to denature DNA irrespective of temperature. The proteins care also useful for commercial purposes. The present sequence represents
